Submission Checklist

What is done, what is open and what to watch for

Checked against `AI-in-SDLC-Home Assignment_1.pdf` on 2026-10-16. "Done" means it exists in the working tree and was verified in this session; "Open" means it needs action from you.

1. The "What to do" list

#	Requirement	Status	Evidence / what is left
1	Fork the repo; extend AGENTS.md; **show that context matters**	Fork: **Open**. AGENTS.md: Done. Context demonstration: Done (added in this audit)	`AGENTS.md`; cold-versus-context comparison in `ASSIGNMENT.md` section 7. You still need to fork on GitHub
2	Skills for the agents	Done	`.claude/skills/{approval-rules,review-findings,run-checks}`
3	Hooks for structured, same-format output	Done	`.claude/settings.json`, `.claude/hooks/*.py`; every log line has the same 27 keys (tool, model, agent, mode, prompt, skills, sub-agents, MCP, human decision, verification, status, files); readable summary in `logs/ai-interactions-summary.md`
4	Spec-driven tool; commit the generated files	Files: Done. Commit: **Open**	`.specify/`, `specs/001-invoice-approval-limits/`
5	Implement in at least two steps, each its own commit with what and why	Built in that order; commits: **Open**	Suggested sequence in `ASSIGNMENT.md` section 5. Steps 4 and 5 share files, so use `git add -p` or combine
6a	Unit tests for the approval rules; review every generated test	Done	177 pass; `test-reviewer` pass recorded in `docs/pr-review.md`
6b	One Playwright test for a rejected over-limit approval	Done	`e2e/tests/over-limit-rejection.spec.ts` passes
7	Review your own PR with the agent; verdict on every finding in the description	Review and verdicts: Done. PR itself: **Open**	`docs/pr-review.md` is the description. See note on the "workshop review prompt" below
8	Log all AI interactions via skills/hooks	Done	`logs/ai-interactions.jsonl`, 189 lines at audit time
9	Multiple agents and sub-agents	Done	5 project agents; general-purpose subagents ran the reviewer roles

2. The "What to hand in" list

#	Deliverable	Status
1	PR on your fork with at least three commits that each stand alone	**Open** (nothing committed, as instructed)
2	Updated AGENTS.md	Done
3	Specification files from the spec tool	Done (uncommitted)
4	Unit tests for every rule including both negative rules	Done
5	One Playwright test	Done
6	Mutation scores before and after as text in the write-up	Done: 63.9% to 100%, text blocks in `ASSIGNMENT.md` section 3
7	PR description listing every finding with a verdict	Done as text; paste into the PR when opened
8	Log file of AI interaction	Done
9	`ASSIGNMENT.md` at the repository root with write-up and video link	Write-up: Done. Video link: Done (pasted at the top of `ASSIGNMENT.md`)
10	The 8 to 10 minute demo video, uploaded and linked	A 9.5 minute draft exists (`docs/video/demo-narrated.mp4` , plus a captions-only copy). **Open:** watch it, upload it and paste the link. Script: document 15

3. Things that were missing and what was done about them

Gap found in this audit	Action
No demonstration that the context file matters (assignment item 1)	Ran a comparison and recorded it honestly, including a failed first attempt. See `ASSIGNMENT.md` section 7
The interaction log contained the user name, the employer folder name and local machine paths	Redacted all 189 lines; `log_event.py` now replaces the project path, the home path, the account name and its short form with placeholders before writing
Mutation run time was unknown for planning the video	Measured: a full run is about 19 seconds end to end
ASSIGNMENT.md did not mention the PDF documentation	Added

4. Open items that are yours

1. **Fork** `NITIN1670/ai-sdlc-demo-app` on GitHub, then point this working tree at your fork (this folder tracks `upstream/main`).
2. **Commit in steps** and push to a branch on the fork; open the PR with `docs/pr-review.md` as the description.
3. ~~Record the video and paste the link into `ASSIGNMENT.md`.~~ Done.
4. Decide what to do with the assignment PDF in the repo root (untracked): leave it out of the commits or add it.
5. Rebuild the PDF documentation after pasting the link: `python scripts/build_docs.py`.

5. Things to be aware of

Topic	Note
Workshop review prompt	The assignment says to run "the review prompt from the workshop". No such prompt file exists in the upstream repo, so the review used the `pr-reviewer` agent's own prompt (`.claude/agents/pr-reviewer.md`). If your workshop gave you a prompt, run it once against the diff after the PR is open and add any new findings to the table
AI tool	The assignment suggests free-tier GitHub Copilot but allows alternatives that meet compliance. This work used Claude Code. State that this is acceptable in your organisation if asked
"All AI interactions"	The hooks log prompts (as summaries), every tool call, sub-agent completions and test results. They do not store the full text of model replies
Reconstructed log lines	The first 12 lines are marked `source: "reconstructed"`: planning and the port happened before the hooks existed
Agents ran as general-purpose	Project agents were not selectable by name in the session that created them
Commit sequence	The tree was built and tested in the right order, but intermediate states were not kept, so commits 4 and 5 need `git add -p`
Language	The assignment allows any language; the upstream is C#, so the backend is a Python port, which is stated in the write-up
Generated video	The draft video is produced by `scripts/make_demo_video.py`: every command runs live while it is recorded, but the voice is a synthetic Windows voice and the narration says the recording was produced by a script. If your reviewer expects your own voice, re-record with document 15
Stryker note	The assignment's Stryker install note applies to .NET only; mutmut was used instead
